

County of San Diego Monthly STD Report

Issue No. 35: Data through November 30, 2011; Report prepared January 31, 2012.

COUNTY OF SAN DIEGO
HHSA
HEALTH AND HUMAN SERVICES AGENCY

Table 1. STDs reported among San Diego County residents, by month (November 2011), and year-to-date.

	2011		2010	
	Nov	YTD	Nov	YTD
Gonorrhea	201	1978	148	1852
Female age 18-25	26	309	26	304
Female age ≤17	5	55	1	32
Male rectal gonorrhea	32	331	16	281
Chlamydia*	1248	12593	1284	12898
Female age 18-25	503	5566	559	5758
Female age ≤17	87	887	84	942
Male rectal chlamydia	51	367	38	312
Early Syphilis (adult total)	42	413	45	417
Primary	9	106	4	81
Secondary	17	160	26	177
Early latent	16	147	15	159
Neurosyphilis**	0	3	0	5
Congenital syphilis	0	0	0	7
HIV Infection				
HIV (not AIDS)	44	445	36	450
AIDS	18	235	27	329

YTD: Year-to-Date

*Chlamydia data through October 2011 due to data entry delay, with comparison data through October 2010.

**Includes confirmed and probable cases of neurosyphilis among cases of early syphilis only.

Table 2. Selected STD cases and rates per 100,000 population for San Diego County by age and race/ethnicity, and year-to-date.

	(All races)		Asian/PI		African American		Hispanic		White	
	cases	rate	cases	rate	cases	rate	cases	rate	cases	rate
All ages										
Chlamydia*	12593	390.5	442	126.9	1077	643.7	2679	271.4	1916	120.8
Gonorrhea	1978	61.3	66	18.9	229	136.9	313	31.7	453	28.6
Early syphilis	413	12.8	19	5.5	37	22.1	124	12.6	214	13.5
Under 20 yrs										
Chlamydia*	2852	324.9	60	71.7	341	692.0	754	211.9	343	101.8
Gonorrhea	222	25.3	5	6.0	44	89.3	40	11.2	27	8.0
Early syphilis	12	1.4	1	1.2	5	10.1	2	0.6	4	1.2

*Chlamydia data through October 2011 due to data entry delay.

Editorial Note: Lymphogranuloma Venereum (LGV)

LGV is a sexually transmitted disease caused by the L₁, L₂, and L₃ serovars of *Chlamydia trachomatis* (CT). While endemic in parts of the world, it remains infrequent in the US; however, outbreaks in men who have sex with men (MSM) in the [Netherlands](#) and [France](#) that seem to be linked to subsequent sporadic cases in the US highlight the need for continued vigilance by clinicians. There are two main presentations, both of which may be associated with systemic illness such as fever, fatigue and weight loss.

- The **proctitis/proctocolitis syndrome**: a risk factor is [receptive anal intercourse in MSM](#). Symptoms include rectal discharge and tenesmus proceeding to frank colitis. Of concern, endoscopy and histologic findings may be indistinguishable from [Crohn's disease](#), potentially leading to a misdiagnosis if a sexual history is not taken and LGV is not considered in the differential diagnosis.
- The **lymphadenopathy syndrome**: begins as a small painless genital papule that may ulcerate and which resolves spontaneously. Two to six weeks later, inguinal/femoral lymph nodes swell severely, with progression to draining abscesses (bubo) in one third of cases.

Diagnosis depends on a compatible clinical presentation coupled with a positive CT nucleic acid amplification test (NAAT) from the affected body site. Note that CT NAAT testing does not distinguish LGV serovars from the more common CT serovars (B and D-K). Serologic tests are unreliable. It is vital to test for multiple etiologies in patients with genital ulcers and lymphadenopathy or [proctitis/proctocolitis](#). Because LGV in MSM is strongly linked to [HIV infection](#), HIV testing is recommended in persons not known to be positive.

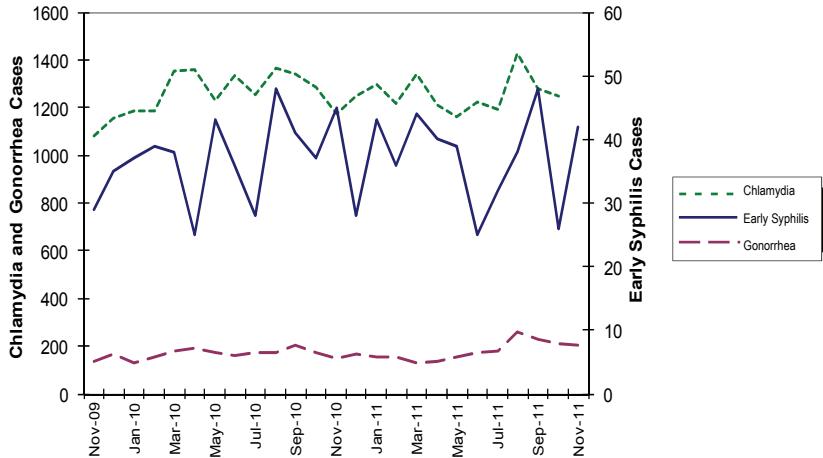

[Treatment of LGV](#) consists of doxycycline 100 mg twice a day for three weeks. Extended courses of erythromycin or azithromycin are alternative regimens. Sexual contacts within the preceding 60 days should be treated with azithromycin 1 gm orally in a single dose, or doxycycline 100 mg twice a day for a week.

Figure 1. Chlamydia,* early syphilis,** and gonorrhea cases reported among San Diego County residents, by month.

*Chlamydia data through October 2011 due to data entry delay.

**Early syphilis includes primary, secondary and early latent syphilis.

Key Points, comparing reported cases in 2011 with 2010

- Overall, chlamydia is stable, but...
 - Chlamydia in females ≤ 17 has decreased 6%.
 - Male rectal chlamydia has increased 18%.
- Overall, gonorrhea has increased 7%.
- Overall, early syphilis is stable, but...
 - Primary syphilis is up 31%.

Note: All data are provisional. Morbidity is based on date of diagnosis. If date of diagnosis is not available, date of specimen collection is used. Totals for past months might change because of delays in reporting from labs and providers.
